## Version: 6.2

| DPIA Reference   | DPIA1148   |
|--|--|
| DPIA Title   | Epic Sherlock  |
| Summary of Proposal  | Sherlock is a web-based issue-tracking utility used by Epic for the investigation of issues, faults or                                     |
| This is provided to Information Governance Steering Group and          | build developments. It has the format of a forum where the EPR team or Epic technical and  |
| Safety and Risk as an overview of the project. It is also published on | customer support staff can raise a ticket for a fault or investigation and others can post   |
| the website and should provide the public with an understanding        | contributions to the thread.   |
| of the information asset and how data is protected as a standalone     | Sherlock is not service desk functionality but used by 2nd line support (EPR analysts) to record Epic                                      |
| statement.   | issues and share information with Epic AMs/TSs.  |
|  | Sherlock itself does not process PID intentionally, although users will have their profiles visible  |
|  | when they contribute to an issue, this is not sensitive and is fully under the control of the user.  |
|  | However, the need to investigate the EPR build, functionality and presentation does inevitably   |
|  | include parts of the EPR hyperspace that is in live use and may contain parts of a patient's health record.                                |
|  | There are a number of ways that this can occur;  |
|  | • Screenshots - taken from parts of the system to illustrate issues, can include patient record  |
|  | extracts in image.   |
|  | Record searches - faults may require searching for patient records with similar parameters, this   |
|  | could return sensitive information as well as demographics.  |
|  | Sherlock does have security measures in place and is the preferred solution for issue resolution   |
|  | rather than other media such as emails that would not be secure for PID.   |
|  | Sherlock prompts the user to confirm if PID or sensitive information is contained in the post and the post will be marked as confidential. |
|  | In training users learn that confidential posts are purged from the server after a set time, and so are                                    |
|  | encouraged to post sensitive information such as a screenshot separately from their resolution   |
|  | commentary so that their resolution is still searchable once the sensitive information has been  |
|  | purged.  |
|  | Access to confidential posts is logged and auditable in the case that users have been accessing the  |
|  | information inappropriately.   |
