

DPIA Reference	DPIA1242
DPIA Title	GROW GAP 2.0 implementation
	All maternity service users have a customised GROW chart generated and then Symphsis Fundal height measurements are plotted onto the graph to determine if foetal growth is within expected trajectories. At present the GROW charts are printed and handwritten measurements are added. The proposed project is to implement the GAP 2.0 online system from the Perinatal Institute. This online system allows the GROW chart to be created electronically by midwives and accessed via an app for patients. This will improve accuracy of fundal height measurments and foetal weight estimation from scans thus increasing safety for service users.
